

## Solution Requirements

|                      |                                                |
|----------------------|------------------------------------------------|
| <b>Date</b>          | 01 October 2026                                |
| <b>Team ID</b>       | SWTID-2026-8742                                |
| <b>Project Name</b>  | Implement Client Script & UI Policy (Incident) |
| <b>Maximum Marks</b> | 4 Marks                                        |

### Step 1: Functional Requirements (FR)

| S.No | Requirement Category                     | Requirement Description                                                                                                                                                                                                | Priority |
|------|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| 1    | <b>Authentication</b>                    | The system shall allow authorized ServiceNow users to access and work with Incident records based on their assigned permissions.                                                                                       | High     |
| 2    | <b>Authorization levels</b>              | The system shall apply ServiceNow user roles and permissions to control access to Incident records and configuration features such as Client Scripts and UI Policies.                                                  | High     |
| 3    | <b>External interfaces</b>               | The solution does not require any external API or third-party database. It operates within the ServiceNow platform and uses the Incident table.                                                                        | Low      |
| 4    | <b>Transactions processing</b>           | The system shall process Incident form changes and apply the configured Client Scripts and UI Policies when users create or modify Incident records.                                                                   | High     |
| 5    | <b>Reporting</b>                         | The system shall allow administrators to review Incident records and verify the results of the implemented configurations during testing.                                                                              | Medium   |
| 6    | <b>Business rules, etc.</b>              | The system shall apply the High Impact UI Policy, automatically set Urgency when Impact is High, validate Assigned To before submitting a High Impact Incident, and control direct State changes through list editing. | High     |
| 7    | <b>Compliance to laws or regulations</b> | The solution shall follow the access-control and data-handling practices available within the                                                                                                                          | Medium   |

|   |              |                                                                                                                                                                 |      |
|---|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|------|
|   |              | ServiceNow platform and the organization's authorized usage policies.                                                                                           |      |
| 8 | <b>Other</b> | The system shall provide dynamic field behaviour on the Incident form and display appropriate validation messages when configured conditions are not satisfied. | High |

## Step 2: Non-Functional Requirements (NFR)

| S.No | NFR Category                          | Requirement Description                                                                                                    | Target Metric / Acceptance Criteria                                                              |
|------|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| 1    | <b>Performance &amp; Speed</b>        | Client Scripts and UI Policies should execute quickly when Incident fields are changed or submitted.                       | Configuration should respond within a few seconds under normal conditions.                       |
| 2    | <b>Scalability</b>                    | The configuration should continue to work when the number of Incident records increases.                                   | Should operate correctly with increasing Incident records without changing the configured logic. |
| 3    | <b>Security &amp; Data Privacy</b>    | Only authorized users should be able to access Incident records and modify the Client Scripts and UI Policies.             | Access should follow the assigned ServiceNow roles and permissions.                              |
| 4    | <b>Reliability &amp; Availability</b> | The configured Client Scripts and UI Policies should consistently execute whenever their defined conditions are satisfied. | 100% success during defined functional test cases under normal ServiceNow availability.          |
| 5    | <b>Usability &amp; Accessibility</b>  | The Incident form should provide clear field behaviour and understandable validation messages to users.                    | Users should be able to understand the required action without technical knowledge.              |
| 6    | <b>Other</b>                          | The configuration should be maintainable and easy for an administrator or developer to understand and modify.              | Scripts and UI Policies should have clear names, conditions, and readable configuration.         |
